

1) 100g, 8g, 25kg

2)

Each interval  
is worth  
4kg.

Each interval  
is worth  
5kg.

Each interval  
is worth  
500g.

1) The second set.

2) Accept any explanation that shows that Ali is incorrect as the mass is 850g.

1) 4 eggs = 300g.  $300g \div 4 = 75$ . 1 egg weighs 75g.  
 $325g - 75g = 250g$ .  $250 \div 10 = 25$ . One biscuit weighs 25g.  
 $3 \times 25 = 75g$ .  $275g - 75g = 200g$ . The chocolate weighs 200g.

2) 5 bars

$1kg = 1000g$ .  $1000 \div 200 = 5$ . If one bar of chocolate has a mass of 200g, you would need five bars to have a mass of 1000g.

3) Accept any correct combinations, such as 4 eggs, 3 bars of chocolate and 4 biscuits.
